ABSTRACT

Prepared for program managers and administrators at Miami-Dade Community College (MDCC), this report presents the placement and follow-up data to be used in a statewide program review process and highlights particular trends in enrollments, completions, and graduate placement for MDCC's occupational programs. The first sections of the report identify its purposes and objectives; provide information on data sources and the method used to determine program enrollments; define program completion and placement status; and indicate that programs are flagged if they: (1) had fewer than 10 enrollees or completions across the last 3 years; (2) had a completion increase or decrease of at least 10 students and at least 20% across the last 3 years; and (3) had fewer than 60% of their completers working in a related field or continuing their education in 1982-83. Next, study results and the factors that may have influenced the findings are discussed. Data on 108 occupational programs are then presented for the years 1976-77 through 1982-83, including the number of enrollments and completions in the program, the number and percentage of completers employed in a related field and those continuing their education, and program flags or notations as appropriate. Finally, summary tables list the programs with fewer than 10 enrollees and/or completers in the past 3 years, and present a rank ordering of programs by the percent of 1981-82 completers working in a related field. (LAL)

Program Review Data:
Enrollment, Completion, and Placement Data
for M-DCC Occupational Programs
as Reported to the State of Florida

## PURPOSES AND OBJECTIVES

This report is an update of one published three years ago (Research Report 80-47) to acquaint program managers and administrators with the summary data sent to the State of Florida, Division of Community Colleges in our Placement and Follow-up reports. Over the past few months, State level deliberations have occurred which will result in a state-wide program review process using both placement and follow-up data and cost analysis data. This summary of the data has two major purposes: 1) to acquaint the reader with the placement and follow-up data available at the State level which will be used in the program review process; and 2) to flag particular trends in enrollments, completions, and placement of completors that appear in the data. These data should prove useful in preparing for one component of the proposed state-wide program review process.

## METHOD AND LIMITATIONS

### Data Sources

Program data on enrollments and completions are drawn from the AA-1 State report. Data on placement status are drawn from the AA-2 State report. The placement status of any particular program completor can be determined from one of three sources; 1) information returned on a

questionnaire; 2) a social security match between the completor and students enrolled in the State University System; and 3) a social security match between the completor and the Department of Commerce files. The logic and data sources for placement determinations are discussed in detail elsewhere and are available from this office. Peculiarities of each particular data source are noted below.

Enrollments. Program enrollment was historically defined by the Division of Community Colleges as student intent to pursue a program of study. This definition was mandated in an attempt to achieve state-wide uniformity in reporting. The definition resulted in a clear distortion of the actual number of students taking program related coursework. For the 1982-83 report year the definition was changed after several years of lobbying by Miami-Dade. The new definition of a program enrollee is a student who has earned 15 credits (excluding developmental or ESL) and has declared an occupational program. With this change, the 1982-83 data are a more accurate reflection of actual program enrollment. In the comparative tables in this report it is interesting to note the change in program enrollees for 1982-83 compared to previous years. For years prior to 1982-83, the enrollment data may be scanned to note any upward or downward trends irrespective of the absolute numbers. These trends would give some indication of student interest although not reflecting well actual enrollment in program courses.

Completions. Program completion is defined by the graduates receipt of a formal award (certificate or degree). Generally there are enough

graduates in each program to note any upward or downward trends for a given program across the most recent three years. An increase in completions might indicate that the program itself is becoming more popular or that formal awards are becoming increasingly advantageous in the job market. A decrease in completions, on the other hand, might indicate that students are leaving with marketable skills prior to graduation and that a formal award gives them no advantage in the job market.

Placement status. Placement status is defined by the completor's activities during the year following graduation. While there are five or six separate placement status categories, from the State's perspective successful placement means that a graduate is working in a related field or continuing education. Success for a program would thus be judged by how many (or what percent of) program graduates fall into these two categories. With this in mind, data are presented for these two categories only. Since the categorizations are made within a year of graduation, a high percent of graduates who indicate that they are continuing their education might indicate that further education was needed in order to be competitive in the labor market.

An important limitation to the employed related field category is that it probably is an underestimate in many cases. Where it is impossible to determine if the field of employment is related, the graduate is categorized as having found "Other Employment" (e.g. not in a related field). This difficulty is encountered in the matches against the Department of Commerce file where the only work information given is a location code (SIC code).

An exhaustive crosswalk has been developed by the Institutional Research office between program codes and location codes to identify related field employment as well as possible. This crosswalk is refined each year but still has severe limitations. For example, a student who graduates in business data processing could be doing related work in almost any location.

The best use of the placement data is to: 1) look for upward or downward trends in the percent of graduates reported as working in a related field; and 2) note those programs where less than 60% of graduates were categorized as working in a related field or continuing education.

Program Flags

The above data, their limitations, and their suggested usefulness, were used to arrive at certain criteria which were applied to the data for each program. In cases where a program's data met the criteria, a note was added immediately following the data. These notes are designated "Program Flags" since they indicate that the program may warrant further study. The following criteria were established and corresponding flags were developed:

1) Enrollments:

   -Fewer than 10 enrollees across the last three years.

2) Completions:

   -Few than 10 completors across the last three years.

   -Completion increase of at least 10 students and 20% across the last three years.

   -Completion decrease of at least 10 students and 20% across the last three years.

3) Placement status:

-For 1982-83 fewer than 60% of completors were working in a related field or continuing education.

## RESULTS AND DISCUSSION

Data for individual programs are presented in the following section, beginning on page 8.. Programs are listed in alphabetical order, and comments are provided via the program flags. While these flags were based upon separate criteria, the combinations that occurred can be informative. For example, an increase in completions but fewer than 60% of completors successfully placed might indicate that there has been a change in the job market, or that graduates are working in fields not easily identified as related. Please note that for the placement status data for 1980-81 the State University System and commerce files were not available. Therefore when examining placement trends the 1980-81 data should not be considered as representative.

Two summary tables have been prepared for your information. Table 1 (page 36 ) lists those programs with fewer than 10 enrollees and/or fewer than 10 completors across the last three years. Note that those programs with fewer than 10 enrollees in three years are all certificate programs. This lack of enrollment might be interpretated in two different ways: 1) for those certificate programs that do not have a corresponding A.S. program, low enrollment may indicate lack of interest; 2) for those certificate programs that do have a corresponding A.S. program, low enrollment might simply indicate that students are choosing the A.S. option.

Those programs with less than 10 completors in three years include 17 A.S. programs. For these, it is important to note that there was not a corresponding lack of enrollment (that is the programs did not show as having fewer than 10 enrollees). Students are thus evidencing interest in these fields but not continuing for formal A.S. awards. It is possible that in some of these programs students leave as soon as they acquire marketable skills, or that they leave with a Planned Certificate where available. Since the detailed program listing in the body of this report is alphabetically arranged, the data for A.S. and P.C. options are presented side-by-side and can be compared to provide program managers with insight into choices students have made over the past few years.

Most of the Planned Certificate programs with fewer than 10 completors in three years also show fewer than 10 enrollees. This indicates that students are not "leaving before completing", but that they are simply not entering these programs. Once again program managers might consider whether students are choosing an A.S. option predominantly, or whether there is simply no interest in the programs.

Finally, Table 2 (page 38) presents a ranking of programs based upon the percent of completors reported as working in a related field for 1981-82. These absolute percents are likely to be underestimates. It is also well to keep in mind that for some particular programs it might be more difficult to identify related field employment based upon location codes. It will be important in the future to determine whether graduates in the programs showing a low percent in related field are actually having little

success in finding related jobs, or if they are finding related jobs but these are not easily identified as such.

As you review the data presented in this report, feel free to contact me if you have any questions. The College-wide Placement and Follow-up Committee is reviewing these data and the cost analysis data and would also welcome any input that the reader could provide.
